A/UX 3.0: Booting to a Known Good Kernel

```
Article Created: 23 March 1992

TOPIC -----------------------------------------------------------

Using A/UX 3.0, when I run newconfig or autoconfig, the kernel becomes
unusable, and I have to reinstall.  On other UNIX platforms, it's
relatively painless to boot to a known good kernel, and then reconfigure
the kernel.  Is this possible on the Macintosh?

DISCUSSION ------------------------------------------------------

The 3.0 newconfig is essentially the same as 2.0.  The way to boot to a
known good kernel is to "launch /newunix" from A/UX Startup.  Then try
/etc/newconfig.
