Pascal II: Compiler Options

The Pascal compiler swapping option (*$S+*) should be used if the compile
fails due to lack of symbol table space. This option should be the first line
of the text, preceding the program statement. Swapping MUST be used in
compiling units. Please see page 68 of the Apple Pascal Language Reference
Manual for more details.

The Pascal compiler list option (*$L+*) should not be used with Pascal version
1.0, since this will result in the loss of the code file and possibly of the
directory. Instead, direct the list to the printer (*$L Printer:*), the
console (*$L Console:*), or to a named file ON ANOTHER VOLUME: for example,
(*$L Mydisk:Myfile.text*). We recommend using the printer. NOTE: This problem
has been corrected in Pascal 1.1, and will work as described in the Pascal
reference manuals.

The (*$U-*) "lex level" compiler option will result in a non-executable
codefile and so should not be used for compiling user programs. This option
is intended for working on the system level; it requires files and information
not available to the user.

Compiler options in Pascal version 1.0 must be in capitals. In version 1.1,
capitals and lower case are interchangeable.
