LANStar/EtherTalk: Macintosh II Bridge Not Available

This article last reviewed: 11 November 1988

A LANStar card and an EtherTalk card can be placed into a Macintosh II
However, this does not bridge the two networks through the Macintosh II. It
merely lets the two networks have branches to the same machine, but there is no
communication between the networks or between machines on the different
networks.

Software written specifically to recognize both cards (and networks) also is
required. This software needs to implement functions similar to those provided
by a Kinetics FastPath for LocalTalk and Ethernet. Currently, there is no
software that we know of that can do this. Northern Telecomm software provides
bridging functions between LocalTalk and LANStar, but it does not do the same
with the EtherTalk card.
