TOPIC -----------------------------------------------------------

I am having problems with an EtherTalk card running very slow on my
Macintosh.  My EtherTalk software is version 2.01.

DISCUSSION ------------------------------------------------------

The version that you are using should be fine, although there has been a
slight upgrade to the driver in the new version, v2.02.  This new version
is installed by using the Network Products Installer disk and the EtherTalk
2.0 disk.

Make sure the network is properly terminated.  Also, try a utility, such as
Apple's Inter•Poll to track the network's performance.  This will show if
an unusual number of packets are getting damaged or lost.

Check software, network (termination, topology, etc.), and the card as
well.
