Macintosh: How to Slow It Down

Article Created: 3 June 1991
Article Last Reviewed: 2 June 1992
Article Last Updated: 2 June 1992

TOPIC --

I am trying to use a Macintosh SE/30 running SoftPC, so I can download from a
DOS device directly into the SE/30 through a port. My problem is that the
SE/30 is going so fast that it is not reading the information I am trying to
dump. Is there some way I can slow it down?

DISCUSSION ---

If you're using System 6, try launching MultiFinder and running one or more
applications in the background. This should slow down processing somewhat. In
System 7, just launch some applications. Turning on file sharing will also
slow down processing.
