Power Macintosh 8100/80AV and NEC Monitor (5/94)

Article Created: 5 May 1994

TOPIC --

I have an NEC monitor connected to the S-Video port on my Power Macintosh
8100/80AV. I get two options at 640x480 resolution:

• 640x480 NTSC-TV
• 640x480 NTSC

What is the difference? Also I cannot see the menu bar, why is that?

DISCUSSION ---

The reason the S-Video output to your monitor allows you two choices at the same
resolution is because of convolution. The NTSC-TV selection provides
convolution and the NTSC selection does not. Using the NTSC-TV option will
provide a raster with substantially less jitter than with the NTSC option.

You can not see the menu bar because you are in the overscan mode. Select a
reduced resolution (underscan mode) and you will see the menu bar.
