Power Macintosh: What Does Native Mean (5/94)

Article Created: 11 May 1994

TOPIC ---

This article describes what Native means when referring to Native Power
Macintosh applications.

DISCUSSION --

First for some definitions.

• Native application, is an application whose executable code is in the
  instruction set architecture of the CPU.

• PowerPC Native application, is an application that contains code only for
  a PowerPC microprocessor.

• 680x0 Native application, is an application that contains code only for a
  680x0 microprocessor.

Since the Power Macintosh provides 68LC040 emulation for application
compatibility, native or native application came to mean executable code, both
system routines and third-party software, which runs on the hardware CPU, a
PowerPC 601 microprocessor. It distinguishes between software running in
emulation, and software running on the hardware.
