Power Macintosh: Error Tones With Upgrade Card (6/94)

Article Created: 10 June 1994

TOPIC --

After installation of the Power Macintosh Upgrade Card in the PDS slot of a
Macintosh, the machine refuses to boot in either 68k or Power Macintosh modes.
Instead, the Macintosh produces only error tones.

DISCUSSION ---

Receiving error tones after installing the Power Macintosh Upgrade card can
indicate a problem with either the DRAM installed in the system or the card
itself.

You may test this by removing the extra DRAM from the Macintosh. If the card
now functions properly, the DRAM may not be within Apple specifications or could
be installed incorrectly.

If the card continues to fail with DRAM removed, disconnect all devices attached
to the SCSI port and test again. If the card continues to fail, try a
replacement Power Macintosh Upgrade Card.
