HyperCard: Card Windows and Positions (7/92)

Article Created: 4 November 1990

Article Reviewed/Updated: 23 July 1992

TOPIC -----

The card window position is now saved whenever a stack is closed (by leaving the stack or quitting, for example).

DISCUSSION -----

Thus, opening a stack always moves the card window to the last saved window position for that stack. This behavior brings HyperCard in line with standard recommendations for window handling in the Mac operating system.

Although HyperCard 2.0 can have multiple windows/stacks open simultaneously, only the loc and visible properties can be set for inactive card windows. "window," for example, no longer works on inactive card windows.
