AppleShare: Why Verifying the Server Can Take So Long

This article last reviewed: 29 March 1988

When an AppleShare server is started up, it initiates a two-pass process that ensures that the PDS (Parallel Directory Structure) is valid. During the first pass, it makes sure that for every entry in the PDS, there is a corresponding entry in the catalog. On the second pass, it does the opposite. A server with a very large number of files can take an hour or more to verify.

If this interval is unacceptable, turn off the server less often. To blank the screen when you don't need to see it, turn down the screen intensity or install a desk accessory that blanks the screen automatically after a period of inactivity.
