## AppleShare File Server 2.0.1 and Macintosh SE/30

This article last reviewed: 22 June 1989

When using the Macintosh SE/30 as an AppleShare 2.0.1 File Server be aware of the following:

- 1) Do not use the System Files on the AppleShare Server Installer Disk. First install 6.0.3 and then install the AppleShare File Server from the Server Installer Disk. Don't select both System Files and AppleShare File Server from the Server Installer Disk. This is contrary to the AppleShare manual (page 35).
- 2) After you quit from the Server Installer Disk and select RESET or RESTART from the Finder, the system hangs. This is a problem in the Installer and 030 machines that appears when you are not using System 6.0.3. The Server Installer Disk does not use System 6.0.3 and should not be updated.
- 3) If running a Macintosh IIX or Macintosh SE/30 as a server, you should use 6.0.3 to avoid file server crashes.
- 4) If your server is crashing, make sure you are running System 6.0.3 or later.
- 5) Do not use Appleshare 1.0 or 1.1 on a Macintosh SE/30 or Macintosh IIX. Copyright 1989 Apple Computer, Inc.
