Interleaf: How To Display Output on a Macintosh

This article last reviewed: 5 January 1990

TOPIC -----

Can you give me in any tips about displaying Interleaf output files on the Macintosh?

DISCUSSION -----

Some of the challenges inherent in this situation included incompatible versions of the software on the Macintosh and the Interleaf environment. Here is a list of the current Interleaf software offerings.

- Interleaf Publisher - Macintosh II, desktop publishing application combines word processing, drawing and painting, charting and graphing, long document management, page layout, and workgroup publishing tools.
- Technical Publishing Software - Provides PostScript output on the Sun, DEC, Apollo, or IBM RT PC machines.
- IBM Interleaf Publisher - Provides PostScript output for the IBM 386 PC.
- PC ViewStation - IBM PCs and compatibles, WYSIWYG document viewing program that lets users display and annotate Interleaf documents.

This product runs on a PC-XT or compatible. SoftPC, from Insigna Solutions, provides PC-XT emulation. Using SoftPC on the Macintosh, we were able to view the Printerleaf file as output from the Technical Publishing Software.

Therefore, the software incompatibility issue became a moot point. Just to recap, using SoftPC running the PCViewstation software, you can view and annotate the Interleaf output files.
