## Macintosh II and SE: A List Of Trap Words

This article last reviewed: 15 January 1988

The following is an excerpt from Inside Macintosh, Volume V Appendix C (the 8/17/87 Final APDA draft, the version that APDA is currently shipping).

This appendix lists the trap macros for the new Toolbox and Operating System routines and their corresponding trap word values in hexadecimal. The NAME column gives the trap macro name (without its initial underscore character). In those cases where the name of the equivalent Pascal call is different, the Pascal name appears indented under the main entry. The routines in Macintosh packages are listed under the macros they invoke after pushing a routine sector onto the stack; the routine selector follows the Pascal routine name in parentheses.

NOTE: Traps that aren't currently used by the system are reserved for future use.

NAME	TRAP WORD
