VideoWorks Accelerator: Macintosh IIci Incompatibility

This article last reviewed: 30 January 1990

TOPIC ---

I have a Macintosh IIci with System Software 6.0.4, a MacroMind accelerator,
and PhotoMac. I get the error message, "System needs the Jackson Pollock
software patch or system may not start up". Have you heard of this error?

DISCUSSION --

Receiving the error message, "System needs the Jackson Pollock software patch
or system may not start up", indicates that the application isn't calling
32-Bit QuickDraw properly. Alternatives include not using 32-Bit QuickDraw or
obtaining an update from the software manufacturer that corrects this
incompatibility.

Some versions of VideoWorks Accelerator aren't compatible with 32-Bit QuickDraw
nor with the Macintosh IIci. Running it under these configurations results in
the above error message. A revision of Accelerator that fixes this problem is
now available. It is free of charge to Accelerator owners on a request basis
only.

PhotoMac is reportedly compatible with the Macintosh IIci and 32-Bit
QuickDraw.
