## Tektronix Graphics Terminal Emulation for Macintosh II

This article last reviewed: 22 December 1988

Grafpoint markets TGRAF-07 and TGRAF-15LR graphics terminal emulation software for the Macintosh II. These two emulators provide the graphics features available on a Tektronix 4107 or 4115 Graphics Terminal.

Grafpoint TGRAF provides the ability to run hundreds of mainframe applications that previously required a dedicated graphics terminal. For example: CAD/CAM, data analysis and representation, mapping, and molecular design.

TGRAF for the Macintosh II has minimum requirements of one disk drive, Macintosh II Video Card with Video Card Expansion Kit (256 colors required), monitor, communications port, and minimum memory of 2Mb (additional memory increases the amount of segment storage available).

Terminals emulated by TGRAF-07 and TGRAF-15LR include:

- DEC VT52
- DEC VT100
- DEC VT102
- Tektronix 4010
- Tektronix 4014
- Tektronix 4106
- Tektronix 4107
- Tektronix 4109

In addition, TGRAF-15LR emulates:

- Tektronix 4115
