HyperCard 2.1 & AV Systems: Bit Depth Workaround (11/93)

Article Created: 19 November 1993

* RESTRICTED: Apple Internal and Support Providers Only *
Not For General Public Release

TOPIC -----

Hardware: Centris 660AV, Quadra 660AV, or Quadra 840AV

Problem: Every time I change the bit depth while running HyperCard 2.1, either in the foreground or in the background, it returns error 123453 and quits.

DISCUSSION -----

We tested with HyperCard 2.1 and verified that you can't change the bit depth to a larger setting without encountering the problem you report. We were able to change the bit depth down, then back up to the original setting. But trying to go to thousands or millions when we began at 256 never worked.

The problem will be fixed in the next release of HyperCard. In the mean time, the workaround is to set the monitor's bit depth before launching HyperCard. Copyright 1993, Apple Computer, Inc.
