TOPIC -----

Can the top case screw in the Macintosh Iivx, Macintosh Iivi, Performa 600, Quadra/Centris 650, or Power Macintosh 7100 be replaced?

DISCUSSION -----

The top case screw used in these products is a captive screw, it is not designed to be replaced if it should be damaged or broken. Drilling out the hole to install a different screw is not recommended as further damage to the case or top cover is possible.

There have been a few reports that this screw has broken. Should this occur, the whole bottom case would need to be replaced.

This screw is not required to operate the computer, so if it breaks or is damaged, the user has a choice to either ignore it or have a new bottom case installed.
