## LaserWriter IINT: Printing Speed from IBM PC

This article last reviewed: 24 May 1988

When printing to a LaserWriter IINT from an IBM PC or XT using the Epson LQ2500 emulation, a reasonable speed is 30 to 60 seconds per page. The printing probably would be faster using an AT, 80286, or 80386 system. Some PC-style computers perform better than others.

The LQ2500 emulation mode, under AppleShare PC, translates all Epson commands and text into PostScript commands before sending the job to the LaserWriter. Aside from normal network traffic delays, the speed of the computer doing the translation greatly increases or decreases performance. Copyright 1988 Apple Computer, Inc.
