LaserWriter: Getting high-quality output

This article last reviewed: 22 December 1985

When using the LaserWriter to produce camara ready copy,
you can improve the results if you follow these guidelines.

Paper:

  Use a stock with a smooth finish, such as standard photocopy paper. (Use
  16-20 pound stock.) The paper should be white and not glossy. Most offset
  printers have paper with these characteristics in stock.

Toner density:

  LaserWriter cartridges vary in darkness according to how frequently they have
  been used. For best results, you should avoid using a cartridge that is too
  black: the increased density fills serifs. We suggest that you print
  somewhat light. The control knob on the LaserWriter offers some control over
  density.

  After replacing an old cartridge with a new one, you should print several
  pages to bring the toner up to a good consistent black.

  If the LaserWriter prints darker on one part of the page than on another,
  remove the toner cartridge and roll it gently back and forth to more evenly
  redistribute the toner.
